

HTTP Status Codes

Backend development study note for document retrieval and grounded question-answering practice.

Status code classes

HTTP status codes are grouped into classes: 1xx informational, 2xx successful, 3xx redirection, 4xx client errors, and 5xx server errors.

Common success and client codes

200 OK indicates success. 201 Created indicates a resource was created. 204 No Content indicates success with no response body. 400 Bad Request indicates the request cannot be processed due to a client-side issue. 401 Unauthorized indicates missing or invalid authentication credentials. 403 Forbidden indicates the server refuses authorization. 404 Not Found indicates the requested resource was not found.

Server errors

500 Internal Server Error indicates an unexpected server condition. A 4xx response usually requires the client to correct the request or credentials; a 5xx response indicates the server failed to fulfill an apparently valid request.
